

Custodian - Model 12

Custodian Floor Safe

Door

The door is made from 12.7mm BS4360/43A mild steel plate with strategically positioned hardened steel sections to protect all vital parts of the boltwork and locking mechanisms. The six moving bolts, of 29mm diameter mild steel, give high security by engaging into individual bolt holes in the body. Two 3.2mm cyanide hardened plates protect the 7 lever lock against a total of 22mm of steel over the door.

Body

The body is fabricated from 3mm and 5mm thick BS 4360/43A mild steel and is continuously welded by CO2 processes. The minimum components are used in the construction of the body reducing weld seams.

Locking

The custodian floor safe is fitted with a high quality level 7 lever key lock as standard, with a European tested 3 wheel combination lock supplied as an optional extra. Multiple locking facilities are available if required. The locking mechanism is further protected by a live anti-explosive device which, once activated, is non returnable against criminals by a permanent lock out.

Fire Protection

A seal of fire resistant material is placed between the door and the body ensuring a high level of fire protection to contents.

Minimum Overnight Cash Cover: £2,500.00*

Volume: 45.00 Litres
